## **Immunopharmacology of Joints and Connective Tissues (Handbook of Immunopharmacology)**

The consequences for diseases involving the immune system such as AIDS, and chronic inflammatory diseases such as bronchial asthma, rheumatoid arthritis, and atherosclerosis, now account for a considerable economic burden to governments worldwide. In response there has been an enormous research effort investigating the basic mechanisms underlying such diseases, and a tremendous drive to identify novel therapeutic applications for their preventions and treatment. Though a plethora of immunological studies have been published in recent years, little has been written about the implications of such research for drug development. As a consequence, this area has not gained the prominence of other new fields such as molecular pharmacology or neuropharmacology, and a focal information source for many pharmacologists interested in diseases of the immune system remains unpublished. **The Handbook of Immunopharmacology** series provides such a source through the commissioning of a comprehensive collection of volumes on all aspects immunopharmacology. Editors have been sought after for each volume who are not only active in their respective areas of expertise, but who also have distinctly pharmacological bias to their research. The series follows three main themes, each represented by volumes on individual component topics. The first covers each of the major cell types and classes of inflammatory responses that can affect them ("Systems"). The third covers different classes of diseases as well as those under development ("Drugs").
